Behavioral Interview Practice Assignment

Tell me about a time you had to deal with a difficult coworker or customer. How did you handle the situation?

A time that I had to deal with multiple difficult coworkers working on a project. It was an assignment that required work with a harsh deadline to be done. The group was four people including myself. In this situation I stepped up to lead, I started with a discussion on brainstorming ideas for solutions to the assignment and considered each idea and put them up to a vote. From there I scheduled a plan of action in order to complete the work identifying each sub-task that was needed. Tasks were divided equally with the team and I worked overtime in order to help and guide my teammates. In the end the task was completed and the boss was impressed with the quality of the work.

Describe a situation where you had to meet a tight deadline. How did you manage your time?

A sharp deadline that I faced was the final assignment from my C++ class, the assignment required that I build a complete database for a Football game tracking the wins and scores of each team. In addition the professor gave a challenge of implementing the project with a

specialized data structure which was out of scope of the class, with a promise of getting an A in the class. At the time I was confused on how I would go about implementing the project. I implemented it in a way such that I can hot swap the data structure with a normal array, which made it a lot easier to test and debug the new feature. I tried a certain way but failed; however I never gave up and spoke with my professor, who gave me a hint on which I figured it out. Out of all the students in the class I was the only one to have completed the project and the challenge.

Tell me about a time when you had to learn something new quickly. How did you approach the situation?

A time that I had to quickly learn something new is when I was assigned the final project in Computer Networks, which was to create a socket-based networked file Sharing cloud server. It was absolutely overwhelming, the list to learn included multi threaded and asynchronous programming, network fundamentals, GUI programming, encryption/hashing/certificates and analytics using matplotlib. None of which is covered in the course which meant that I had to learn all this on my own. How I did it, I started out with a small, basic socket server, then I added feature after feature which made the whole project easier as I was able to break each system to byte size chunks that I can process. In the end while other students were struggling implementing it as a whole, I was smooth sailing the entire way.

Tell me about a mistake you made at work or school. What did you learn from it?

A time where I made a mistake at college while I was taking computer security, they had a lab assignment that I had made a mistake in setting up two virtual machine. The assignment details how to set up two computers one Windows OS and the other Parrot OS. The idea was that the windows OS had to turn off some security settings in order to test out how the Parrot OS VM could hack the windows OS and get a shell through metasploit. The problem that I had was that the exploit did not seem to work, even though I followed the instructions many times it seemed hopeless. I contacted the professor and found out that everyone had the same problems with it. It turns out that even with the security settings turned off, newer Windows machines automatically detect and disable the metasploit exploit.

Describe a time when you had to work as part of a team. What role did you play and what was the outcome?

A time when I had to work as a part of a team is when I did my Capstone project. It was about integrating an AI chat-bot for a medical company on top of their existing solutions. The problem was that I had no knowledge on AI, I hadn't taken any AI courses at that time. Because I told my team members this and they had no problems with me having no AI experience. It turns out they need people who have different backgrounds, not just in AI. I fit well into a role in designing the front end of the systems designing the website and knowledge in a flask back-end API system which both I had experience in.
